Hi,

i need to get the name of the current aspx file in code-behind.
Assume the current aspx file is "myfile.aspx", i want to put value
"myfile" into a variable in code-behind.
Is that possible?

You can get the name of the current `_class_` via `GetType().Name`. This may or
not be the name of the file, but then I can't tell if you mean file or
class.
