Tim,

No problem. Just to make sure, did you run `aspnet_regiis -i` from the v2.0.x folder? I've run into situations before where I could not get the ASP.NET tab to show up in IIS, but ASP.NET would still work correctly.

About the Application Pooling Issue:

IIS can only run one version of ASP.NET at a time in each app pool. So, if you have existing ASP.NET 1.x applications and you decide to configure a new ASP.NET 2.0 application under the same App Pool. The ASP.NET 1.x applications will start throwing exceptions.

Check out this link for more details:

[http://msdn2.microsoft.com/en-us/library/1kdfe21k\(VS.71\).aspx](http://msdn2.microsoft.com/en-us/library/1kdfe21k(VS.71).aspx)

Thanks,

Page Brooks

Page:

Thanks for the response. I already ran `aspnet_regiis -i`. No joy. I'll give your app a whirl and see if that helps.

I'm unfamiliar with the separate AppPools issue. Can you give me some guidance with that, please?

Tim

I've run into this problem before. You can try running this little utility to switch the version of ASP.NET for a specific web application:

Re: .NET 2.0 Master Pages problem

<http://www.denisbauer.com/NETTools.aspx>

Please be aware that you need separate AppPools for each version of ASP.NET that you are running. I've seen this unexpectedly bring down many applications before.

I have a windows 2000 server on which I have installed the .NET 2.0 Framework runtime. I have an application I've written using VS 2005. In it, I use master pages. When I debug this app on my machine, it looks great. When I run it on the server, it looks like crap – no master page goodness is being employed. This is the first ASP.NET 2.0 application I've put on the server. I noticed that there is no ASP.NET tab on the properties window as there is on newer Windows server editions. How can I tell IIS that this application should be run as ASP.NET 2.0?

Tim
