Hi Stacey,

Regarding on the Master page, it can help define some contentplaceholder that can be override/custeomize in concrete page which applied this master page. However, for Theme, it is always applying on concrete page(rather than master page), or you can configure the Theme in web.config for all the pages in this web application.

For the problem you mentioned (theme work for header section), would you provide some further description? You may provide some template fragment of your master page content, such as how to declare the label and the header section that need to apply theme/skin.

BTW, for ASP.NET 2.0 Theme, are you using Theme or StyleSheetTheme? If you're using StyleSheetTheme, make sure you haven't define default value for any control's attribute in page template, this will cause the StyleSheetTheme's value be overwrite.

Please feel free to post here if there is any other finding.

Sincerely,

Steven Cheng

Note: The MSDN Managed Newsgroup support offering is for non-urgent issues where an initial response from the community or a Microsoft Support

Re: anyone used master pages/themes

Engineer within 1 business day is acceptable. Please note that each follow up response may take approximately 2 business days as the support professional working with you may need further investigation to reach the most efficient resolution. The offering is not appropriate for situations that require urgent, real-time or phone-based interactions or complex project analysis and dump analysis issues. Issues of this nature are best handled working with a dedicated Microsoft Support Engineer by contacting Microsoft Customer Support Services (CSS) at <http://msdn.microsoft.com/subscriptions/support/default.aspx>.
