I agree w/ George... and doing it on the DB side is the better option. If using "UNION", be careful... you probably want "UNION ALL" instead.

The union would not work unfortunately because it is using the same database.

It is completely dependant on what the user actually inputs into the screen as to what I am adding to the grid.

Basically there are 2 distinct types on data for the grid, and they can't be mixed up. So I was just going to create separate datatables and then merge them together.

It seems like I will have to just try the looping or the merge method , because I don't think that it will work any other way really.

Thanks guys!
