no, I enter it in 3 times then it takes me to an error page: 'you are unable to view this page'.

I even have a web site were I have:

```
<identity impersonate="true" userName="myDomain\testuser" password="1235"/>
```

in the web.config file and Im prompted for a username and pwd and even when I type in the username and pwd i get the samething. 'you are able to view this page'

Okay, let's try to find what's wrong there. I've just tested it on my remote server box and that's working well without prompting me for password.

1. Why do you set impersonation? Do you need it?
 2. Which Authentication method is used in IIS? Properties – Dir.Security – Auth.Control – Edit
 3. Which Authentication mode is used in web.config?
