Hi Gang,

I need to persist error info between the Application_Error block in Global.asax and the custom error page. I am trying to use the built-in Application class. I am writing this code in the Application_Error block:

```
Application["errInfo"] = info;  
Server.Transfer("~/Error.aspx")
```

When I try to access the "errInfo" object in Application, I get nothing. Here is the code in Error.aspx:

```
info = (string)Application["errInfo"];
```

I can use the Application class in other parts of my project but it does not seem to work when I use it in the Application_Error block. Thanks for any ideas.

Steve

ps: any other ideas about how to get the info into Error.aspx?
