I have a website that curently have an admin section with which a user can manage site . I use the cookie name set in web.config file for authenticating the admin user of the site. Now I am gonna add normal user membership other that admin to my site. I have a problem regarding "authentication cookie name" for normal users as I have already used that for admin users. As you now I am not allowed to define another authentication cookie name at folder level.(But application level). So what is your recommendation to this problem ?? Should I use a normal cookie other that the one defined in web.cofig file to authenticate users . I need this . I will appreciate your help . Thanks in advance.
