1. Is the SQL Server Express database in the new application's App_Data folder ?
2. Are you detaching/attaching the SQL Server Express database correctly ?

I published my application in the same file system (different folder) on same PC.
This is the connection string I use
<add name="pagoConnectionString" connectionString="Data Source=.\SQLEXPRESS;Initial
Catalog=pago;Integrated Security=True;User Instance=False"
The database is in folder
C:\Programmi\Microsoft SQL Server\MSSQL.1\MSSQL\Data
My working solution is in D:\WEB\WASP
I published in C:\WEB\WASP
and it also works except than the db WEB forms with gridview

Sounds like your connection string needs to be different
at the server where you published your application to.

Re: No db access after publishing web site

news:6Ciai.14217\$BU3.3863@xxxxxxxxxxxxxxxxxxxxxxxxxxxx

I developed my first web site using Visual studio 2005.
It works very well with Visual Studio. But after I published
the web site in a file system
folder in my PC using
the instructions I found in Visual studio help Walkthrough:
Publishing a Web Site, I can
navigate the web forms
except the ones with connections (using Gridview, details
view) to the database (SQL Server
2005).

What didn't I do?

Thank you

Agos
