I've also used a solution for public domain "single sign on" scenarios where we've delivered a "public key" to the customer to encrypt a user name and password pair into a 64-bit hashed string and pass it back in the URL where we would then unencrypt it and use the the credentials to authenticate the user and auto-generate thier forms authentication ticket. It's a bit elaborate but it works.

I like the web service and temporary GUID solution as well. That's one I've never thought of before but seems rock solid if there's minimal trust between the 2 environments for integration purposes.

"Patrice" <<http://www.chez.com/scribe/>> wrote in message news:OLhTVMMyvHHA.5036@xxxxxxxxxxxxxxxxxxxxxxxxxxxx

IMO *they* should redirect to your site based upon the web service result (if credentials are not valid, they'll need to display the page again). They'll likely then pass a guid associated with the user you returned to them so that you know which user it is. Make sure this is a temporary guid so that it is not usable for ages if stolen (changed at least each time a new login request is issued).

Or else Chad solution that would be what you would do for your inhouse servers (though I would likely prefer to be "explicit" about such a link with external world).

Oh BTW, you may want to explain the overall goal as I'm not sure to have caught the details (basically if all they do is hosting the login page you could perhaps have a customized login page for them on your own web site ?). They are not using those credentials at all at their site ?

So what you mean is I write a web service to accept the user id and pwd that they passed and do authorization, But how can I redirect them

Re: What is the best way to login my website from another website?

Re: What is the best way to login my website from another website?

```
value="" />  
<input type="hidden" name=" EVENTARGUMENT"  
id=" EVENTARGUMENT"  
value="" />  
<input name="txtUserID" type="text" size="18" />  
<input name="txtPWD" type="password" size="18" />  
<input name="Submit" type="submit" style="font-size:  
10px;"  
value="Login" />  
</form>
```

But we got the error
Invalid postback or callback argument. Event validation is
enabled
using <pages enableEventValidation="true"/> in
configuration or <%@
Page EnableEventValidation="true" %> in a page.

I do not think Disable Event validation is a good idea.

Is there any other better approach?

Thanks a lot.– Hide quoted text –
