Hi,

The feature I like in "forms authentication" is that, it first sent to login page, and be auto forwarded to the requested page after login.

And I noticed that this is accomplished through a URL modification when calling login page.

like

<http://www.my.com/login.aspx?ReturnUrl=%2fprotectedPages%2fprotectedPage.aspx>

I will try to simulate this URL thing... and to a manual redirect to the login page with the requested URL.

Hope this calling login page manually will auto redirect after login to the "original requested URL".

Question is... if this works... are there any issues that I have to worry about?

Thanks
Nalaka

Hi,

I have a asp.net application with forms authentication enabled.

Users create private (database driven) messages (pages; like a message board) that is only viewed by logged in users.

Now I need to give the users the ability to publish these messages to the public (if they decide the content is public safe).

Question is... is there a method to override forms authentication?

For an example; some thing like a method... where I look at the URL and return true or false... so forms authentication is ignored based on this method return value....

Re: asp.net forms authentication override based on individual pages.

Basically to programatically ignore forms authentication for that request only.

Any direction is deply appreciated

Thanks

Nalaka
