I have a web.config in my application that contains the connection strings to all my datasources. I want to move these connection strings to another web config up the folder hierarchy so that all my apps can use the same connection strings. That is supposed to be how it's done, no? Instead of the web.config being in c:\inetpub\wwwroot\myApp\web.config, I have it in c:\inetpub\wwwroot\web.config. However, I get an "Object reference not set to an instance of an object" error when I do this. This used to work fine in Visual Studio 2003 .net 1.0.

My connection string is fine:

```
<connectionStrings>
<add name="myDB" connectionString="Data Source=mySvr;Initial
Catalog=myDB;Integrated Security=True "/>
</connectionStrings>
```

And this is how I retrieve in in the web app:

```
_sSQLConn =
System.Configuration.ConfigurationManager.ConnectionStrings("myDB").ToString
```

What am I doing wrong?

Thanks for your help.
