

Server Application Unavailable on hosted server, not locally though

I wrote a few webservices in VB .NET 1.1 and have verified they are functional on localhost. The website they are intended for is paid hosting (I don't have direct access to the server) that supports .NET 1.1.

After transferring the project to the site if I try to browse to the .asmx file it always comes up with the standard "Server Application Unavailable" error.

Sometimes I have been able to get it to show me the available services by browsing to the site but after any change and re-upload I always have to go through an arduous guessing process for an hour or so before getting it to show the services again (usually by luck; I have no idea what makes it finally work).

Can anyone tell me what is at play here? I hope there is a standard way to just update my web services locally, upload them, and have them available without going through hoops to change a hidden setting.

Thanks,

Dalton
