Thanks John & Steven, I've implemented a solution based on your suggestions.

Hi Brian,

Regarding on your current scenario, are you using the ASP.NET's built-in forms authentication? Or have you also adopted the ASP.NET 2.0 membership/roleManager services? If so, I think it is quite convenient to implement the security structure you want. Here is the steps for you to configure them:

\*\* Normally, forms authentication by default will allow everyone access "login.aspx", this is the login entry. Therefore, you will not need to apply particular secure setting on it

\*\* For other aspx pages in your application, you can simply set them to allow only authenticated users(who has login) by the following authorization setting:

```
=====
<system.web>
.....
<authorization>
<deny users="*" />
</authorization>
.....
=====
```

\*\* For the Default.aspx page, if you want to make it also available to all users(authenticated or unauthenticated), you can use the <location> element to apply a dedicated authorization setting for it. e.g.

```
<configuration>
```

I'm hoping this is a really easy situation to solve. ASP.NET 2, C#

I've got these pages in a directory:  
Default.aspx // I want this page to be accessible by anyone  
EditGrid.aspx // I want this page to be accessible only after you've

logged

in at Login.aspx  
Login.aspx // This is the simple login page in order to access  
EditGrid.aspx

Basically, Default.aspx is going to show a grid of data with no editing/inserting/deleting capabilities and is viewable by anyone. EditGrid.aspx is a page just for me (or other editors), and in order to

get

to the page, you need to enter the appropriate credentials at Login.aspx.

Is there an easy way to set this up?

Thanks,  
Brian
