I have a reportviewer control. I programmatically set the local report path based on a drop down on a page. This allows the user to choose which format (RDLC file) to use when generating the report.

The first request, the report processes properly, however if I choose a different report format, the old report still renders. I'm doing a .refresh for the report...

I tried turning off Viewstate for the report, but it says that Viewstate must be true for the ReportViewer control.

If I "reenter" the page as new (such as by clicking on my menu item for that page), it will then run the first report type chosen.

I'm changing the local report path such as

```
ReportViewer1.LocalReport.ReportPath = "myreport1.rdlc"  
or  
ReportViewer1.LocalReport.ReportPath = "myreport2.rdlc"
```

Any ideas?

It never fails that I ALWAYS find the answer to my question 10 minutes after I post...

Must do a

```
ReportViewer1.LocalReport.Reset()
```

first. Then set your reportpaths, then do a  

```
ReportViewer1.LocalReport.Refresh()
```

You must have VS2005 SP1 for this.
