I am building a set of shared functions and subroutines in a vb file located in my App\_Code section of my application. The first three functions went fine and work as expected. But I am now starting a subroutine that must work with certain server variables and I have been stopped cold.

This is the code that frustrates me:

```
Sub GetConfig()  
Dim strPathURL as string  
strPathURL = Left (Request.ServerVariables("Path_Info"),  
InStrRev(Request.ServerVariables("Path_Info"), "/"))  
....  
end Sub
```

Visual Studio states that [Name 'Request' is not declared.]

Indeed, it does the same for any statement I try that uses 'Request', 'Server', 'Session' or 'Application'.

I started the VB page with:  
Imports Microsoft.VisualBasic

Imports System.Data

What more do I need to do? Thanks!!

.
