Integrated Windows Authentication overrides the Anonymous authentication default.

I'm not so sure about that since both Anonymous and Integrated Windows are checked simultaneously. If selecting one disabled the other, I would expect that you would not be able to select them both together. I believe that selecting both allows IIS to have the benefits of both. VS needs integrated Windows authentication to make debugging work.

When you "only turned on Integrated Windows Authentication", in effect, you are requiring *all* clients which access your application to have an account on the server which is hosting it.

re:

- !> Integrated Windows Authentication must be on in order to debug the application

Which OS are you using ? Which version of IIS are you using ?

XP Pro. SP2 / IIS 6.0

There's different solutions for different OS/IIS versions.

There's a slew of reports/solutions for the problem you report at :

<http://www.google.com/search?hl=en&q=debug+%22Visual+Studio%22+%22Windows+Authentication%22>

Yes, I've already seen those but that's not really the point of my post.

Re: Using IIS w/ASP .NET 2.0 Web Application Projects

Even with what you are saying, I should be able to see the page I'm trying to access since I do, in fact, have a Windows account on the development server that I'm testing against and even still, I get a 403 error.

fobidden error

When you run ASP.NET with Windows Authentication
enabled,
every single account which accesses the application must
have
permission to access the app expressly granted.

Have you considered using Anonymous Authentication or
Forms Authentication ?

Anonymous Access is on by default. I only turned on Integrated Windows
Authentication (in addition to the automatically enabled Anonymous Access)
because Visual Studio complained that Integrated Windows Authentication
must be on in order to debug the application.

Or, are you set on creating a Windows user account for every
single user of your App ?

Re: Using IIS w/ASP .NET 2.0 Web Application Projects

See above.

In my ASP .NET 2.0 Web Applicaiton
Project, I've changed the server setting to use
IIS. I then created the virtual directory (from
the button in VS) and then went and enabled
Integrated Windows Authentication. The site
consists of just a single default.aspx file with
nothing in it. When I attempt to run the
project, I get an http 403 access fobidden
error.

What am I missing?

Thanks.
