Of course look at other websites hosted on your ISP, and see if their websites are slow also. It could be a slow server. Use basic troubleshooting techniques

Hey Sam,

Thanks for the help. I will look into all the resources you gave me. Is it any guarantee that it is a programming problem that is slowing it down? Is there any possibility that it may be a hosting problem? I've tried to go through them and have gotten nothing, but the programmers we outsource to sort of point the blame elsewhere.

Thanks again for the help.

Adam

This is something your outsourced programmers should be able to take care of. If they can't make it faster or prove that it is running within acceptable parameters (which depends on whatever contract you have with them), then you might want to look into finding a different company to outsource to.

That said, there are lots of places to look. Start with the database and SQL Profiler. That will show you what queries are running and how long they take. That is usually where bottlenecks exist.

Then you can use can HTTP monitor like Fiddler or Charles to browse through your site and see how long individual requests take.

<http://www.fiddlertool.com/fiddler/>

Re: Website Running Slow Please Help.

<http://www.xk72.com/charles/>

If the requests take significantly longer than the queries, then you need to dig deeper either by using ASP.NET's trace functionality or a profiler or performance monitor. I think a profiler would get you the fastest results, but you really need to be a programmer to be able to use one and understand it's output. I like redgate's ANTS Profiler myself.

http://www.red-gate.com/products/ants_profiler/index.htm

If you can find a bottleneck, then the best thing is to feed this info back to your programmers and have them fix it and also document how you found it and express that you're doing their job for them blah blah blah.

HTH,

Sam

We're hiring! B-Line Medical is seeking .NET Developers for exciting positions in medical product development in MD/DC. Work with a variety of technologies in a relaxed team environment. See ads on Dice.com.

Greetings all, I am the Web maintenance guy for a non-profit org, and have been getting a lot of complaints that our website is running slow (and I agree at times), we run asp.net but outsource our programming. I was wondering if maybe you could help out and give me any clues as to why our website could be running so slow. I've spoken about it with our programmers and they said they have changed some of the code so that it doesn't hit the database as often which makes sense but I saw little to no change really. The website especially runs slow if it's not cached in your browser and from google analytics most of our daily visitors are new.

I am not sure if it is a hosting problem or a programming problem, that is why I posted in this group any tips/hints/ideas and help is welcome.

Re: Website Running Slow Please Help.

the site is www.orbis.org

Thank you all very much in advance.– Hide quoted text –
