I have never been able to get the Asp.net configuration web application to work on a remote server. It's really designed only for local machine operation. However there are several open-source apps that replicate this app. You can also write your own "admin" app that performs a lot of these functions programmatically.

The ASP.NET Configuration tool is great for quickly managing users in the database on my development machine.

However, I don't see a way to use it to access the database on my Web server. Is this possible?

Thanks.
