Don't rebind the data in Page\_Load every time. Use, for example, a If Not Page.IsPostBack Then and only bind then. The viewstate is reconstituted prior to Page\_Load, so you will overwrite every time if you bind there.

I've got a gridview with a column of checkboxes. If I check off any number of them, and perform a postback, they all go back to being unchecked. What options do I have for getting around this?
