What happens if you manually set a text field on one of the controls in the page's pre-render event. Does the change get reflected ?

If not, does it get reflected if you do the same for the user control ?

Take some basic steps to see where this is falling down.

I have some user controls that are inside a formview control. I use the usercontrols in the EditItemTemplate, ItemTemplate and the InsertItemTemplate of the formview. In a 3 templates the user controls have the exact same name (uc1, uc2, uc3).

In my formview_modechanging even I am trying to autopopulate the user controls, if data exists. I debug the code and I can see the before and after results of the text fields changing etc... in each user control. It seems to work fine.

But, when the code finishes and the form is shown they are still untouched/empty.

Any ideas what could be wrong?

Thanks.
