sorry for the near-dupe post (also in .security), but im desperately trying to find an answer to this...

i am attempting to configure security for an intranet web application in ASP.NET 2. it uses Windows authentication, retrieving roles from our Active Directory. nothing too unusual.

what is unusual: it works for users that are VPN'ing into our network from the outside (using cisco vpn), but DOESNT work for normal desktop users in the office.

for both the browser (IE) pops up the windows login dialog. afterward VPN users get in and i can see their name, check their User.IsInRole("foo"), etc.. no problems. in-network users? cant authenticate their credentials.. get this after 3 failed attempts:

HTTP Error 401.1 – Unauthorized: Access is denied due to invalid credentials.

Internet Information Services (IIS)

....any ideas why?

Windows Server 2003, virtual directory under default website. in "Directory Security" tab in IIS i have:

- unchecked "Enable anonymous access"
- checked "Integrated Windows authentication"

....my web.config of course uses the Windows authentication mode.

this is maddening! thanks for any help

sm

.
