I have posted this question, which I think is very simple on several sites, and nobody seems to know what I am talking about. At my wits end here. Please help.

I am putting together a site for mobile devices using regular ASP.NET controls after giving up on "Mobile Web Forms" for several reasons. Two problems.

## LinkButton

=====

The LinkButton control does not work in Mobile 6.0, even though it works fine with the Mobile 6.0 emulators. My particular make and model is Palm Treo 750, but I am observing similar issues with other brands such as HTC, and Kiser.

When the user presses a LinkButton, it simply does not respond. Is there a setting in the browser that can change? I know that it works with Mobile 5.0, but not 6.0 (although emulators seem to have no trouble with it). I suppose one option is the replace all LinkButtons with Buttons, but I really don't want to do that.

## Page Anchor

=====

Can't get it to work. When my URL looks like "myhpage.aspx?id=85565#A" to redirect to an anchor within a page, it does not work in any of the mobile devices I've tested with including emulators. Is there a workaround to this? This is very important since the limited size of the mobile screen, so I want to do what I can to help the user not have to scroll a lot.

I have put together a sample application to demonstrate my problem. Here is the link to it.

<http://junk.petrotools.com/From.aspx>

The code files are really simple.

## LinkButton control and page anchor not working in Mobile 6.0

```
<br />  
<br />  
<br />  
<br />  
<br />  
<a name="A">Here is my anchor</a>  
  
</div>  
</form>
```
