Hi, It works! I guess it must know what the parent window is to be able to reload it.

Thanks!

Hi, thanks for the response.

I tried adding

```
<body
```

```
onunload="opener.location.href=opener.location.href;"></body>
```

to the source of the second page but get the error

element body can not be nested within element td. I placed

the code as

follows in the second form aspx file.

```
<asp:Content ID="Content1"
```

```
ContentPlaceHolderID="ContentPlaceHolder1"
```

```
Runat="Server">
```

```
<body
```

```
onunload="opener.location.href=opener.location.href;"></body>
```

Re: cause webpage one to reload when webpage two is closed.

followed by several html tables.
Anyhow just wondering where to place the body tag?

Also the way the user gets to the second page from the first page is just a hyperlink.
thanks.

Hi I tried a google search
but could not find anything.
I am trying to cause
one webpage to reload when
a second web page is closed.
The second webpage
loads data into a session
variable and when closed I
need to reload the first
page loading in the data
from the session variable.
Since I need to close
the sescond form just setting
the post back url to the first
page on the
close button from the
second page is not quite
what I am looking for.

Hi Paul,

Re: cause webpage one to reload when webpage two is closed.

Try to add the following code to your second web page

```
<body  
onunload="opener.location.href=opener.location.href;">
```

The BODY element contains all the content of a document, including TD and TABLE. It can be nested within HTML element only. It seems that you are using Master page and it means you should change a BODY element of the Master page. If Master page is used for many Content pages then you can either make a copy of it (to apply changes to the BODY tag), or you can set your Master page body tag to:

```
<body id="mBody" runat="server">
```

Then add this on the page that has to be closed:

```
public void Page_Load(Object sender, EventArgs e)  
{  
    HtmlGenericControl body =  
    (HtmlGenericControl)Master.FindControl("mBody");  
    body.Attributes.Add("onunload",  
    "opener.location.href=opener.location.href;");  
}
```

Re: cause webpage one to reload when webpage two is closed.

I didn't test it, but I think it should work.– Hide quoted text –
