thanks for the additional information. I had thought of setting the parameter as you suggested, then I think the application could still be moved with a rebuild. I also thought of a seperate windows application to run at night that would clear the temp directories as long as it could figure out which ones to clear.

I see.

You can try creating a virtual directory in IIS under your application root, map it to a physical folder outside the application root and store the reports there. But I am afraid this may restart the application too.

You can also setup a parameter in the web.config that will tell you the physical path to the report data storage.

thanks for the response. I am setting up a data storage area
for reports
and
am allowing users to store files that are associated with a
report. The
report just collects a bunch of information and the report
number is
generated based on this information entered. I am just using a
temp
folder
as am allowing uploading before the report is saved (as they
are entering
the
data). When the report is saved the temp folder name (just
using the user
ID) needs to be changed to the report number, so it is like
Temp/ReportNumber/all the files.

Renaming directories from a web app
doesn't look like an elegant
solution.
Perhaps you should explain in short what do
you want to achieve.

Hi it looks like it is resetting
the application as you
stated,

Re: changing folder name

target.MoveTo(Server.MapPath(newpath));//copy
to new directory

I do not want to hardcode a
path in since the application
is moved to
different servers but
wondering if there is a way
to do this using
something
similar to Server.MapPath.
Only think is it can not be in
a subfolder
of
the
project (so it will not cause
a reset!). Also wondering if
a copy and
then
delete would cause a reset as
well (if in a subfolder of the
project?)Thanks.

Be carefull
here....
By
changing
folder's
name you
will restart
an
applicaiton
(if it's a
subfolder in
application
folder) even
if the
subfolder
does not
have
single
..aspx file

I
did
a
google
search
but
could
find
what
I
was
looking
for.
I
am
creating
a
temporary
folder
and
placing
files
in
it
with
a
web
application.
The
temporary
folder
name
needs
to
be
changed
dynamically
by
the
program,
leaving
all
the
files

Re: changing folder name

Re: changing folder name

in
the
folder.
Just
wondering
if
anyone
has
done
this?
thanks.
