Hi All

I have a database which has it's own set of tables for users etc

I already successfully use the Login control by handling the Authenticate event and checking the suitable values against my own DB.

Now I need to use the ChangePassword control but I cannot stop the system from trying to create a database.

I would implement my own membershipprovider but that really seems like a lot of work.

Is there a way customising the ChangePassword control so it calls my code to check if the change is valid and to actually perform the change?

Many thanks in advance
