If you don't have a router then you are all set, just have to make sure your firewall software is not blocking the inbound traffic on port 80. go to <http://www.ipchicken.com/> to find out your IP address then ask one of your friends to go to

<http://<IP Number from the Chicken>/youAppName/Default.aspx>

All I have is a cable modem.
Something I can do in XP?

thanks

If it's just one time deal, just open up port 80 and configure your router to send port 80 to your IIS computer, then send your external IP address to whom ever you want to see the website. Afterwards you can close port 80 on your router.

I have a roadrunner personal page internet site.

I just found out it does not support ASP.NET.

I've developed an asp.net site that I would like to show someone.

I can't image this is possible but I have to ask to be sure.

Re: View asp.net site on a computer ?

Is there any way I can send him something (maybe on a cd)
that he can
view on his XP computer.

He does not have VSxxxx I'm sure.

Who is a good isp that supports asp.net?

Does ms publish list?

thanks
