You are not forced to deploy this db. Either you have something in your web.config that tells to use this db either your provider is forcing its use.

Though creating a dummy db would solve your problem I would rather check the web.config file to make sure it is not used unintentionaly (as you don't need it locally it would seem your hoster is forcing (unintentionaly) this use ???).

If the DB was just on my computer, I could do it long time ago, but the database, which is aspnetdb – a specific database, that for some unknown reason, Microsoft enforce someone who deploy his site to have, should be on the hosting site only SQL-Server 2005.

I try some ways to create a database :  
founded on  
[http://www.4shared.com/file/59591680/a5b7abdf/ASPNETDB\\_TMP.html](http://www.4shared.com/file/59591680/a5b7abdf/ASPNETDB_TMP.html),  
... then by Microsoft SQL Server Management I created a "bak" file,  
but the hosting provider tell me everything O.K, except I should send him a SQL-Server 2005.

I don't know how to check the version of SQL-Server 2005 (of the link above),  
but if I found a link as the previous one (for SQL-Server 2005), it would be fine.

I just need a file : backup file or script file, that I can put on the hosting server, without any problems.  
I am searching that file (.bak or .sql of SQL-Server 2005 version), but I didn't find yet.  
I don't know why just putting a file on the internet, and save efforts

Re: create aspnetdb from scratch

creating it, since this is a standard file (aspnetdb), that always should be when deploying my site.

If you have a link to that file (bak or sql for SQL-Server 2005 version), it would be great.

Please, help.

Thanks :)
