Hi Everybody,

I would appreciate it if you can give me a hand here.

I want to use the two codes, below, together to do the following when the "IN" button is clicked (InBtn_Click):-

- 1- Create (or open) output.txt, and
- 2- Type the current time (hour only) in it.

I tried to include the first code inside the handle function in the second code, but it does not work. Can anybody tell me who I am going to work the two codes together?

Each code works fine by itself. The message box inside the handler works fine when "IN" button is clicked. The the output.txt file open and the current time will be stamped inside it when I use it in a different function. But if I put the first code inside the handler function of the second code, then, when I click the "IN" button, I would not get what I am expecting, Which is to open output.txt and stamp the current time.

First code:

```
FileStream* fs = new FileStream(S"output.txt", FileMode::Create);
StreamWriter* sw = new StreamWriter(fs);
String* TimeString = System::DateTime::Now.ToString("HH");
sw->WriteLine(TimeString);
sw->Flush();
sw->Close();
```

Second Code:

```
private: System::Void InBtn_Click(System::Object * sender,
System::EventArgs * e)
{
```

```
// If I put the first code here, output.txt would not be created and current
```

How to use file I/o codes with forms and controls codes

time

//would not be stamped.

```
if ( mark == '-')
```

```
{
```

```
MessageBox::Show(" You can't sign in twice! ",S" Error ");
```

```
}
```

```
}
```

--

Thanks

Allen
