Hi,

strange problem here – sorry, but i don't know all the english terms because i have a german version – i try to describe it:

- my project is in debug state
- i've added a "reference" to a DLL (assembly?)
- i've added the namespace of the DLL to the using-clause
- now i can work the classes, compile, debug – no problems

- now i've switched to release state
- when i try to compile now i get some errors that the class is unknown or the namespace is not specified
- i can fix this by removing the "reference" (delete in the project-tree) and adding it again! Then i can compile etc...

Now it happens everytime i open the project. I have to delete the reference and add it again to be able to work with it.

The DLL is laying in the directory together with the projectfiles (solution, project, c#-files etc.)

```
\VSS-Projects\  
  \MyProjekt\  
    – solution-file  
    – project-file  
    – all c# files  
    – some other stuff for VSS  
  
    – The DLL/Assembly
```

Why? What's wrong here?

Boris
