Hallo Todd,

Thanks for the reply. I am not in the office today. So I can't give you the exact error message. (Will do tomorrow) The message is like : ... "is connecting to a transport connection which was closed", or something like this.

It throws a webexception. Like I said the thing is very, very strange. It can't have something to do with the certificates. The whole thing works connecting to an asp page. It can't have something to do with php, because the whole thing works when I use a PC with the same source to connect. Same with the server. It's the same test machine and both PHP and ASP are in the same virtual directory, secured with the same certificate. I can't be my programming, everything works not using SSL, only SSL makes problems and only in conjunction with Php and only on the ppc, not the pc.

One Thing: The error also occurs when I use httpwebrequest directly, not using the client web services classes.

Thanks a lot

Chris

P.S. I can't rewrite the web service using asp.net because finally the web service will run on an AS/400 machine.
