we have a small pocketpc application that uses a webservice to connect to SQL2000

everything works fine until we try to build a customer version. we just overwrite the existing references using the customers IP address where the webservice will reside. but as are network is not able to see the IP address it creates an error.

is there a way around this or do u just overwrite every instance of the IP address in the reference.map and .disco files?

any help would be greatly appreciated.

Cheers,
Craig
