- 

Hi all

I have a generic "Wizard-like" app that I use to run my applications. This loads the taskflow logic + UI elements from dlls (specified in a config file).

So, what I want to do is this

- 1) New solution
- 2) DLL Project with task flow
- 3) DLL Project with UI factories
- 4) Add existing EXE (Forms app)

All simple so far, except that the EXE doesn't directly use any of the DLLs etc, and may be used by other solutions to run different apps.

So my question is this. Is it possible to make some kind of project that only states which files to deploy and then specifies the EXE as the app to run?

Pete

.
