You can use ListView. Or you can use DataGrid with data source other than DataSet, e.g. ArrayList with custom objects. Keep in mind it's not going to reduce startup time to zero.

Hi Ilya,

Thanks for your reply. Is there another control that I can use instead of the datagrid that can have mutiple columns with headings but can be 'manually' loaded from a datareader? I just want to load a small number of

Re: Speed using a dataadapter and datagrid

records and let the user select one. If I can avoid a dataset, then I would really like to.

Thanks & Regards,
Matthew

On a first run big DataSet code needs to be JITed, which takes some time. It's not that long, probably around 10 seconds, but you have to wait.

I have several forms that use a dataadapter to fill a datatable and display the records in a datagrid. The first time in my app that any one of these forms is displayed, it takes a long time to load even when there are only 2 records to display. Any subsequent time that one of these forms is displayed

Re: Speed using a dataadapter and datagrid

the speed is fine.

Is there some sort of initialisation thing happening here? Anything that I can do to increase the speed? Is it the dataadapter, the datatable or the grid that is causing this?

Thanks in advance for any advice.

Kind Regards,
Matthew Pascoe
