Thank you very much.

Depends on what you mean by "intercept".

The scheduler will preempt execution of lower priority threads with higher priority threads. There are some cases where the priority of a thread gets increased by the scheduler to prevent inversion or deadlocking, and a thread has a quantum, so it might not run to full completion if it takes a long time (> 50ms) and there is another thread at the same priority waiting.

Can a high priority thread intercept a lower priority thread in the middle of a function ?
