You don't need to loop through the collection to find the selected items – use the SelectedIndices property. e.g.

```
If ListView1.SelectedIndices.Length > 0 Then  
    MessageBox.Show(ListView1.SelectedIndices(0).ToString)  
End If
```

An item may be selected but not currently have the focus (indeed the focus may be on another control).

Peter

Hi, Peter  
the following code doesn't work:

```
Private Sub ListView1_ItemActivate(ByVal sender As Object, ByVal e As  
    System.EventArgs) Handles ListView1.ItemActivate  
    MsgBox(ListView1.FocusedItem.Text)  
End Sub
```

This one display message:

```
Private Sub ListView1_SelectedIndexChanged(ByVal sender As Object,  
    ByVal e
```

Re: ListView events

```
As System.EventArgs) Handles ListView1.SelectedIndexChanged  
Dim item As ListViewItem
```

```
For Each item In ListView1.Items  
If item.Selected = True Then  
ClickIndex = item.Index  
MsgBox(ClickIndex.ToString)  
Exit For  
End If  
Next  
End Sub
```

Please, advice  
Thank you

Hi, All  
I have ListView1 populated with one column (.NET 2003  
version 1.1, SP3)  
I need to populate second ListView2 with a few columns  
when user selects  
row  
from ListView1.  
I tried to extract the value of the selected row in  
ListView\_SelectedIndexChanged() event and  
ListView\_ItemActivate(), but  
seems  
it doesn't work.  
What event fires when row selected in the ListView? Or how  
can i activate  
event?  
Please, advice  
Thank you
