Thanks eric... I have another question that may seem a bit odd.
As an alternative to the previous question can I have both an apache and iis server on the same server box (same virtual directory) and use the iis server to host the webservices that touch the java objects?

My guess is yes. You can set up IIS to access directories being used for the Apache server as virtual directories. Not sure why you would want to do that. If the Java code is accessing a database, it would seem more efficient to access the database directly.
