Hi Simon ,

Thanks again!

Simon, after following the command suggested below i could only imported the certificates to certain store(i dont know where it went physically in system:-()...

still i dont see the certificate after clicking on 'select from store' using signcode wizard '

and how to get the corresponding private key(is the key a file or number ?) and where can i locate the key?

could you please tell me the detailed step to do it? it would really help!

"Simon Hart [MVP]" wrote:

You need to add your cert to the certificate store on your dev machine for nice integration with Visual Studio.

Execute on the command-line: start c:\windows\system32\certmgr.msc then import your cert using the wizard.

Hi Simon ,

Many thanks for the answer!

I tried to use signcode.exe , I am not able to see any certificates under 'select from store' option in Digital signature wizard to choose .

How to get the reuired certificate under 'select from store option'.

Which is the right certficate to choose and where can i locate them...i need to sign a test dll and i dont want the message to pop-up as i described in my first mail.

What is the select from file otion? can i choose the certificate file as well?

I have asked too many questions...wish i dint bug u up:--)

"Simon Hart [MVP]" wrote:

Yes by signing your code using a digital signature provided from Verisign or Thawte. You can sign your code using signtool.exe(.NET 2.0 and later) or signcode.exe (pre .NET 2.0). You can also create your own digital signature using makecert.exe.

Is there any way to avoid the below message while dynamicaly loading the a dll into windows mobile 6, without signing the dll ?

"Starting this program requires a component from an unknown publisher.
You should start the program only if you trust the component's publisher. Do you want to continue?"
