As you've gotten a couple of replies letting you know that there is no native support for this, I thought I'd let you know about a possible solution.

Our MetaDraw component will support your requirements. This is available as a .NET Winforms component for use in .NET Winforms applications, or as an OCX control for use in standard applications or in a web page.

MetaDraw will allow you to draw shapes (by code or you can allow end-user to draw with mouse) and remove shapes. You can group shapes into containers (our equivalent of layers), and you can remove shapes. You can allow the user to drag shapes around, resize them, rotate them. When grouped into containers, you can allow user to select, move, resize entire container. You can change the layering order of shapes or entire containers. You can hide or show shapes or containers. Other features include UnDo and ReDo, Scrolling, Zooming, Save and Load, Print.

Check it out at www.MetaDraw.com

I'd be happy to answer any questions
