I tried having the class library in the same folder and a separate folder. Also, I suspect that you have both VB6 and VS.NET (2002/2003) installed on the same partition. I was able to get the app. to work in the VM/partition where VS.NET 2003 resides. I fired up the dll from a vbs file.

The GAC install is still an issue because on the VB6 VM/partition there is no gacutil.exe. A real test of the client and server working together is to deploy the server (.NET exe/dll) to a client app. environment that is completely separate from the development environment.

I'm heading into my office in a little while. I suspect that my .NET class library (server) is not being registered properly so it can't be found. Partial registrations are a pain in the caboose.

Please let me know if you come up with any other ideas or suggestions. Thanks in advance.
