I have narrowed the issue down to where we are using Public components in our BaseForm. These are ErrorProvider, ToolTipProvider, HelpProvider, ContextMenu.

Here's the problem when I'm using Enterprise Templates:

- 1) If I set the Modifier property to Public from Friend on the controls on the BaseForm, the IDE consumes all the memory on my machine (1.5 Gig's) and will eventually open the form about about 5 minutes.
- 2) If I leave the Modifier property as Friend, I don't get this problem, but then I can't see or use these controls in my inherited forms.

This is only a problem if I am using Enterprise Templates.

I'll let you know what happens when I make the changes as you have instructed.

I am using VB.NET for our Enterprise Application.
