Yes,
The task manager is not working properly.

<user411> wrote in message news:uiVL60GeHHA.4032@xxxxxxxxxxxxxxxxxxxxxxxx

.Net 1.1

I have developed an app that uses alot of double buffered forms. When minimized the app only uses about 1 meg of memory (as shown in taskmgr). Does garbage collection get triggered when you minimize?

When restored, the app starts at around 8 megs, then creeps up towards 100 megs. Is this normal? Is the double buffering using garbage collected buffers or is it implemented at a lower level then then dotnet framework?

just wondering, thanks
