Hi Robson,

I tried a very simple remoting solution in which I am just throwing an exception from the remote object for example: `throw new Exception("My Exception");`

Now from the client, I called this remote method in an infinite loop, this should have caused the windows remoting service to shut down but that didn't happen even after 4 hours of continues loop.

But my another Windows service, which is unfortunately in production is going down after working for few hours.

I am really clue-less here, what is going on.

Any idea?

Thanks and regards,
Vishi

Thanks Robson for your reply.

I have implemented exception handling now where I am catching all managed and un-managed exceptions because I am using some COM components as well.

I will definitely try it out and will let you know the results.

Is there any chances that this Windows Service is going down because of heavy traffic on my website? Does windows services with Remoting meant for working under huge loads?

Kindly let me know.

Regards,
Vishi

Robson Siqueira wrote:

Windows Services, in general – IMHO, stop unexpectedly due to an exception.

I had this problem before several times. I strongly recommend you to verify your code again and put new try/catch sections to get the error.

Hi Friends,

I am facing a weird problem while using ASP.Net application and a .Net Reporting server.

I have my remoting server configured using a Windows service, my object is stateless and hence I have them configured as Singlecall.

My web application communicates with my above remote server using tcp/ip on a specific port.

Now, what is happening is, my Windows service is randomly shutting down all by itself, so I have to manually restart it whenever it goes down and so I have to monitor it regularly.

Also, I have to resart my web application because it stops communicating to remote server whenever Windows service goes down and I restart it manually.

Any kind of help in this will be highly appreciated.

Thanks,
Vishi
