Hi,

I have a client/server pair which use .Net Remoting. I make remoting classes another project and compile it as DLL. It works fine but I have some doubts about security.

When I use a network sniffer to catch the network packets, I can see the namespace, class name, name of method and all parameters which are used to call that method very easily.

My first question is What kind of security should I implement to prevent this? ( or at least it is possible)

Also Can someone who doesn't have my DLL but knows the class name, method name and parameter list call my remote method? If it is possible how can I prevent it?

Thanks,  
Kivanc
