I'm having a problem with logging into a vpn. I know the router has the correct ports opened (1723) with PPTP and IPSEC passthrough enabled. I've used the router before for a VPN and have had no problems with it.

When I try to log in, I connect, but then I just sit there at "Verifying username and password" for about a minute, and then get error 721. Everyone says you only get that from the router blocking protocol 47, but I have PPTP passed through, so I think it has to be a setting on the server itself. The VPN was working, but broke when I installed MS Sharepoint, so I had to uninstall sharepoint to try to get the VPN working again. Unfortunately, it's never worked since then. I can VPN in using the basic IP that's assigned by the router on the network (192.168.1.xxx), but not with the web ip (209.23.xxx.xxx).

.
