To place the mscorefg.msc into a setup package at this point in time is a bit of a scripting nightmare. Microsoft has only placed the mscorefg.msc and dll into the SDK package, but if you look at the caspol.exe tool in .Net V2 Framework it shows a script to actually set the security permissions, which can be scripted into an install package. Also I am currently investigation, install.exe, gacutil.exe, regas.exe etc (<http://msdn2.microsoft.com/en-us/library/d9kh6s92.aspx> – microsoft Framework V2 tools) to find a work around solution for my company – besides packaging the 380MB SDK V2 Framework with our product.

Hope this helps a bit more and allows someone to come up with a simplified solution beside setting all the security permissions by command line within batch or scripting files using caspol.exe
