Hello,

Can someone please tell me how to perform authorization using GenericPrincipal in WS Secure Conversation.. Or any other way of doing it..

Even if it required to be done for every web method, there is no name information available in the SecurityContextToken that is exchanged...so how can I look up the database or Active Directory for the user..

Also if I do it at the time when the user signs the request for the token with his username and then retrieve his groups in CustomUSernameTokenManager, how do I reference it in the Web Methods??

Please reply to my mail and let me know if there is a solution to it...Please..

Thanks and Regards,
Sumaira
