I posted this question on the Amazon forums but am not getting the answer.

From Amazon I have downloaded two files for a generated X.509 certificate.

cert-*.pem – certificate file

pk-*.pem – private key

The cert file imports correctly but the WSE app doesn't run because the cert doesn't contain the private key. I assumed that this is the pk* file, but it doesn't import. Not a valid file.

Since others are using Amazon with WSE I assume that I am doing something wrong.

Can anyone help? I would appreciate any help.

Tom Richards
