Just got this message today after installing our web services on a virgin box. For us, the problem was apparently the method we used to set up the server, and the order in which we installed components. You may need to run the aspnet_regiis.exe program, which is located in
\WINNT\Microsoft.NET\Framework\v1.1.4322.

Use the /? option to find the command line parameters from the dos prompt. We did the /i option to install 1.1.4322.
