

How do I get credentials of other active logon sessions for Web Service?

I am trying to call my Web Service from my embedded Windows Forms control that is embedded in an HTML page using No Touch Deployment. When I try to call my Web Service from my Windows Forms control using CredentialCache.DefaultCredentials, I get the logged on user credentials even if the user authenticates using a different logon through IE. How can I get the credentials that IE uses and assign it to my Credentials attribute of my Web Service Proxy object?
