If I uncheck anonymous access, then the webservice will fail with a permissions error.

Can you answer my original question?

How can I set permissions, so my webservice will run, without entering my name and password in the Web.Config file?

There are two problems with my working webservice:

1. I don't want a username/password in web.config file.
2. I don't want anonymous access enabled.

Thanks

Russell Mangel
